

The Healing Power of Stem Cell Therapy

If you are in pain, your damaged or inflamed tissues are calling out for help. Stem cell therapy can deliver that help by healing the injured tissues. Your body is sending out signals or cues for stem cells, which actually attracts them to the injuries in your body.

Instead of masking the pain with injection blocks or medications, stem cells release growth factors which help control the inflammatory response that in turn heals tissue and other cells.

Stem cells might seem like science fiction to some people, but the scientific results are in — and convincing. People are experiencing remarkable results because once stem cells are deployed, they respond to damaged tissue as a homing device would and expedite healing directly at its source.

Heal Naturally Without Surgery or Pain Relievers

It is one thing to learn about stem cell therapy — it is another to consider trying it. The Mayo Clinic has a lot to say about it, as do scientists and patients who have witnessed results. Is it for you?

- Would you like to avoid surgery?
- Are you interested in a proven way to naturally relieve your pain?

Stem cells are at the center of a cutting-edge field of science called regenerative medicine. These so-called “unprogrammed” cells in the human body can best be described as “shape shifters.” They have the ability to “shift” or change into other types of cells.

Because stem cells can become bone, muscle, cartilage and other specialized types of cells, they have the potential to treat many different conditions. Benefits include:

- Rapid Pain Relief
- No Downtime
- Regeneration of Healthy Tissues
- Fewer Risks than Surgery
- Healing without Surgery

This is a safe procedure. The stem cells we administer are screened in compliance with FDA regulatory standards. If you suffer from any type of joint, tendon or ligament pain, you are a candidate for stem cell therapy. Some of the areas stem cell therapy addresses include:

- Knee Pain
- Carpal Tunnel
- Shoulder Pain
- Hip Pain
- Tennis Elbow

NU LIFE
MEDICAL
Live Your Best Life

Get back to all the little things you used to do without pain — and the big things you have been wondering if you will ever do again.

Still Not Sure? You Are Not Alone.

Here are some common questions that patients have:

Is stem cell therapy FDA-approved?

The stem cells we administer to our patients are screened in compliance with FDA regulatory standards as well as certified through the American Blood Bank and American Tissue Bank.

Where do you get your stem cells from?

All of our stem cells for therapy are from an exclusively accredited tissue bank. The stem cells are harvested from willing and un-compensated donors (parents of live birth and cesarean section).

Prior to donation, patient health is rigorously screened and only those who pass screening are allowed to donate. The stem cells are then carefully processed by licensed professionals and a sample from every donor is kept on file by the harvesting company and the FDA.

Does health insurance cover stem cell therapy?

Stem cells are not yet covered by insurance. However, our stem cell protocols are much less expensive than other forms of stem cell treatment such as bone marrow aspiration (BMA). Stem cell therapy is also far less expensive than surgery which can cost, on average \$25,000 or more. If you add up hospital bills, surgical procedure fees, and physical therapy, knee replacement surgery can cost \$57,000.

Do you have payment options for my treatment plan?

Yes, we have financing available based on credit.

Our Philosophy

Some pain clinics simply administer injections, create treatment regimens, and send patients on their way (often to surgery). We are different because we genuinely care — and have seen the disappointing results surgery can deliver.

We help our patients to feel better and heal naturally by accessing the most current, effective methods available. Joint pain presents a serious obstacle for not only the person experiencing the pain, but for their friends and family too because often the one suffering can no longer do many things they used to.

Lack of mobility and independence can have a negative effect on a person's mood, even bringing on depression, and no one wants to see their loved ones struggle this way.

Solutions offered by other clinics can be limited to pain relievers, cortisone injections, or invasive surgery. Before they come to us, some patients have even been told, "You are going to have to live with it."

(We did not like any of those choices either.)

It is our mission to offer a better, less invasive, more permanent solution that scientifically addresses the pain through healing. We help our patients live their best lives, naturally.

"As a result of a lengthy athletic career including playing professional basketball in Europe, I experienced numerous injuries to my ankles, knees, hips, shoulder, back and neck.

These injuries caused me to be in constant pain and discomfort for over 15 years!

I tossed and turned at night, and surgeries, therapies, and heavy medication only gave me temporary relief.

After hearing about the benefits of Stem Cell care, I attended a seminar and my first thought was, "This sounds amazing."

I signed up for a consultation, and had stem cell injections in my knee, back, and shoulder. This life-changing decision eliminated my pain and I no longer need pain medications, therapy, or surgery.

I feel very grateful and fortunate!!"
